

Flicker: Key Questions

We'd like your input!

If you have ideas, comments, or suggestions for how to address these issues, please send your comments and supporting technical justification to info@designlights.org.

- Should the DLC require flicker performance to be reported on the QPL? Why or why not?
- Are values for depth of modulation and frequency of flicker appropriate metrics to report? Are there other values needed?
- How could performance under dimming be reported?
- What standards should the DLC be pointing to?
(IEEE committee (PAR 1789) recently established guidelines for safe levels of flicker; California's 2016 Title 24, Part 6 residential lighting standards recently established a test method and set flicker performance requirements for residential products; NEMA 77 was recently published.)
- How should this information be provided on the QPL?
- Are there other considerations the DLC should be thinking about?
