

# Field-Adjustable Light Distribution: Key Questions

## The DLC would like your input!

If you have ideas, comments, or suggestions for how to address these issues (or any others), please send your comments and supporting technical justification to [info@designlights.org](mailto:info@designlights.org).

1. Is the requirement for testing and compliance with DLC specifications in only one manufacturer-selected light distribution setting sufficient? Should additional testing be required at additional distribution settings? Should the DLC require the product to meet DLC requirements at more than one setting for the Primary Use Designation it is applying for?
2. Are there types of light distribution adjustments that should not be eligible for listing under this policy? If so, why?
3. The policy proposes a new SSL QPL text field, “Adjustable Distribution Setting”, to describe the light distribution setting at which the product was tested. Is this text field sufficient to be informative and useful for the stakeholders? Is it important to standardize descriptions of the distribution settings in this field? If so, how?
