NLCS

# Proposed DLC Role

## Standardized NLC Selection/Project Reporting Tool

# Discussion Questions

1. Which control strategies for energy savings (e.g., occupancy sensing, high-end trim, etc.) and key features for ease of use (e.g., mobile app for configuration and startup) should be required on every project and system participating in the “Room Controls” program?
2. Which capabilities and features are beyond scope? While they might fit into other, more complicated incentive programs, they’re not essential for this simple, replicable program. For each one, explain why.
3. How should project eligibility be determined? Please address the sub-questions below and/or any relevant considerations for the scope of the program
4. How can we better characterize this program beyond the name “Room Controls?”
